

Prompt:

Write a Python program to swap the values of two variables entered by the user. Use a temporary variable to store the value of the first variable during the swapping process. Finally, display the values of both variables after swapping using the format() method.

Program:

```
#Python swap program
```

```
x=input('Enter value of x:')
```

```
y=input('Enter value of y:')
```

```
#Create a temporary variable and swap the values
```

```
temp=x
```

```
x=y
```

```
y=temp
```

```
print("The value of x after swapping:{}".format(x))
```

```
print("The value of y after swapping:{}".format(y))
```

Output:

```
Enter value of x:3
```

```
Enter value of y:4
```

```
The value of x after swapping:4
```

```
The value of y after swapping:3
```
